<ul style="list-style-type: none"> The Managers intends to achieve the investment objective of the Underlying Fund by investing substantially all the assets of the Underlying Fund in money market and short term interest bearing debt instruments and bank deposits. Our research process is fundamental and valuation driven, and bottom-up in approach. For Singapore, Asia and emerging markets, the Managers’ team of credit analysts conducts a detailed credit analysis that evaluates industry outlook, business review, financial review, management expertise, strength of ownership and specific debt structure. This results in an implied rating score. Relative valuation will determine corporate credit selection. For rated issuers, mainly US/Europe high grade issuers, to supplement the fundamental analysis by their G10 credit team, the Managers have implemented a quantitative credit risk approach based from the KMV model. This model uses the Merton option framework to calculate the implied asset volatility or the Expected Default Frequency (EDF) of any corporate bond issue. Other inputs include an asset correlation database, which is generated from a proprietary risk management system. Together, the model will calculate the return-expected loss trade off for any corporate bond issue. The Underlying Fund may use or invest in financial derivative instruments for the purposes of hedging existing positions in a portfolio, for efficient portfolio management or a combination of both purposes. With effect from 8 June 2020: Units are Excluded Investment Products. Accordingly, the Underlying Fund will not invest in any product or engage in any transaction which may cause the Units not to be regarded as Excluded Investment Products. 	<p>Refer to Paragraph 16, 17, 22 and 27.4 of the Underlying Fund’s Prospectus for further information on the investment focus and approach of the Underlying Fund and its exposure to financial derivative instruments.</p>
